        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B B

Eur. J. Biochem. 264:525-533(1999).

FUNCTION: SUPPRESSES STRONGLY THE SWEET TASTE RESPONSES IN THE RAT WITH HIGH SPECIFICITY TO SUCROSE, GLUCOSE, GLYCINE, AND SACCHARIN. WITH HIGH SPECIFICITY TO SUCROSE, GLUCOSE, GLYCINE, AND SACCHARIN. THIS EFFECT IS REVERSIBLE, BUT COMPLETE RECOVERY OF THE SUPPRESSED RESPONSES REQUIRED AT LEAST 3H. GURMARIN SHOWED NO EFFECT OR ONLY A VERY WEAK EFFECT ON THE SWEET TASTE SENSATION IN HUMANS.
                                                                                                SEQUENCE FROM N.A.

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

        of hits satisfying chosen parameters:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             length: 0

Pred. No. is the number of results predicted by chance score greater than or equal to the score of the result to have a being printed,

and is derived by analysis of the total score distribution.

AAZ35104

AAZ35104 standard; DNA; 12 BP.

AAZ35104;

13-MAR-2000 (first entry)

DNA encoding endoplasmic reticulum retention signal.

Endoplasmic reticulum; retention signal; monocotyledonous plant; monocot; rice; wheat; transgenic plant; mammalian polypeptide; antibody; expression cassette; ss.

Synthetic.

ER retention signals (see AAY32395-96), 5' untranslated regions and leader peptides are employed in various combinations to provide high expression yield. Plant cell or seed containing polypeptides selected from Fv, Fab, F(ab)2, diabody, dimeric scFv, whole antibody and four-chain secretory antibody are claimed. Multi-chain complexes such as four-chain secretory antibodies are produced by expression of component polypeptides from separate vectors, all introduced into the same cell by transformation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             signal (see AAY32395). Levels of mammalian polypeptide expression in transgenic monocotyledonous plants can be enhanced by use of this signal. The invention provides rice, wheat and other monocot plants that have been transformed with expression casettees for production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 5; 76pp; English

                       acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI32073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method of a transgenic plant, a plant body cell, a plant body, growth of a plant body, an anti-human calisivirus monoclonal antibody, and the detection of a calisivirus. This polynucleotide sequence represents DNA relating to the human calisivirus detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP;
                                                                                                                                                                                                                                                                   Set of oligonucleotides, useful for diagnosis and cell designed to detect single nucleotide polymorphisms and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide
                                                                                                                                                                                                                    Claim 1; SEQ ID 27147; 29pp + Sequence Listing; German.

                                                                                 acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cyrosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-09-696-872-37 (1-4)
                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The cligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989, and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fig. wipo.int/pub/published_pct_sequences.

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABC9989, are oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cyrosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABP00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 represent the oligomers described in the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
